I use Pixelmator for almost everything, and it doesn't do that because apparently it's a vector property, not a pixel. I've tried Inkscape/GIMP, and it works, but feels awkward, and CorelDraw/Illustrator is too expensive. I'm looking for something that can give results like this, but it gives me control over the shape of the curve. Pixelmator Team today launches its latest free update, Pixelmator Pro 1.7. A feature of the hero of this issue is the addition of curved versions of the text. Now it is very easy to draw a text on a curve, or any way of free form. In addition to the standard Type tool, there is now a drop to expose alternative text layouts: circular, path and freeform. This makes it very easy to add decorative text to your compositions that are traced around the perimeter of your stage, revealing a lot more creativity. The new text tools support all standard typographical functions, including the interval settings between letters, to blur the text across the entire width of the path. Also new in version 1.7 is the new welcome screen at the launch of the app, which adds simple shortcuts to the latest documents, and the ability to rotate the canvas from any angle. This rotation does not affect the exported image, but it may be useful to look at the current composition in a different way when designing the final part. Just use two fingers on the trackpad to turn the canvas. The app evokes satisfying tactile feedback when tied to regular 90 degree intervals. You can get Pixelmator Pro exclusively from the Mac App Store. Find out more on the developer's website. FTC: We use income earning auto affiliate links. More. Many DIYers want to create curved text for images and graphics without spending a ridiculous amount of time or money. Since not every online editor can create a curved text I would mention a few solid choices for this. Also, these inexpensive online curve text generators like I would call them so easy that anyone can do it. In fact, I would use these 3 free curved text tools to make circular text designs on transparent backgrounds that go into my design, which can be done with any editor I use! While some may not like that extra step it literally takes 2 to 3 minutes and adds a lot of flexibility. My goal is always to use the best editor for in the easiest and most flexible way. Note: This is a pretty long article because I list the steps for editors (GIMP and Inkscape), however, if you want a shortcut just to view the video. Online Curve Text Editors vs Downloadable Curved Text Editors In this case, Can have your cake and ice cream too, as they say, because there are choices for creating curved text and options include both online text editors as well as downloadable ones. Previously I demo'd the simplest low cost online curved text editor in my article Circles of Words - curved text around circles. It's so simple that I can make curved text or word circles in about 3 minutes, it takes longer to choose the style of font and color than to make the text curve around the circle. Now it's simple! So now I'm going to show you two more ways with free downloadable software to create curved text if you don't want to use an online editor. The 3 free curved text tools I like are: Inkscape Gimp PicMonkey So while PicMonkey uses text along the arc the other 2 tools use text along the way, in this case in a circle. I used all 3 and Inkscape is my personal favorite for just creating text effects. GIMP and PicMonkey also work with the addition of curved text on the images. Frankly, PicMonkey is the easiest, but not many options to adjust the interval between emails or add a lot of special effects. Check out my PicMonkey article here at Word Circles - Curved Text. Around Circles - PicMonkey Inkscape Curved Text - Easy Peasy Curved Text Tool While I'm a Mac user using Inkscape on any OS possible. I hate to admit it, but there's actually more Inkscape documentation using Windows than using a Mac, but still the basics of Inkscape work on any OS. The concept of Inkscape is to create a circle, create text, transform each object into an Inkscape path, and then place the text inside or on the outside of the circle. It's pretty simple, but a sequence of steps is important; You'll see why soon. Since Inkscape is a vector graphics program, I don't recommend trying to import an image just to put curved text on it. However, on the positive side, with Inkscape you can change the size of the curved text on the fly without any loss in resolution and there are a ton of special effects that you can also apply to the curved text to make it look even cooler. It's super easy to do just check out my article on it here. So here's how to use Inkscape to create curved text. (text along the way) Open Inkscape, click on the create and edit text objects (F8) to add text. Use the top bar of the menu text to change font, size, kerning, etc. Use the color palette at the bottom or edit, objects, gradients ... The button at the top to get filled and stroke the dialog box, which will also change the color. Now add a circle with the button to create circles, ellipses and arcs (F4). Keep the ctrl to make the circle otherwise it will become oval. (You can create text around this too using the same Click the pick and convert (F1) button, then hold the shift (for multiple choices) and click on the text and circle. Choose the text at the top, then put on the path, but you're not done because the text is not where you want it. The size of the circle is so that the text fits in about half the way, and the use of corner handles will allow the text to move to the readable place. First click on the corner handle, then drag to turn. Turn. Click and hold the CTRL to keep the circle shape, drag the angle arrow in or to make the text the desired size. Repeat until the text is size and where you don't want it. Note that this curved text is convex by default. Now select the curved text by clicking on it. Go to the path of the object on the way. This converts the text into a path object. Then click on the circle and remove it. To keep the curved text on a transparent background, add an alpha feed, as I'll show in my article, and then export the text as a png file. What if you want it to be concave rather than convex? The process is similar. Using the above steps to create curved text, we're just going to flip it over. Repeat using steps 1-5, then to make it concave, just press the Flip button of the selected objects vertically. Finish with steps 6 and 7. Check out the GIMP-curved text here - GIMP circular text - Make circular text designs. GIMP circular text works very well; Posting it on top of an image, photo or graphics can be used for design or social media posts. Creating curved text with GIMP requires more steps than with Inkscape or PicMonkey, but GIMP is a very powerful tool, especially as a photo editing tool, so it's worth learning how to use GIMP to create circular text. I say this because GIMP is much more like using Adobe Photoshop while Inkscape is closer to Adobe's Illustrator, but both free software do so easily. So here's how to use GIMP to create circular text in an instant. First, create a new image file after GIMP is opened. Click to create a new image and set the size (sizes). This will create an area of the canvas to work with. I'll create a design that is 600 x 600 pixels. Then add horizontal and vertical guides. Go to the image of the guide to qqt; new guidance on interest. Click normally to add a horizontal guide. Do it again for vertical leadership. Go to the guide's zgt; on percentages, click on the drop and select Vertical to add a vertical guide. Add a circle using guides as a center. Use the Ellipse Select tool. In accordance with the tool options (for Ellipse), check the fixed option (1:1 side ratio) as well as the Expand From Center option. Mouse over the intersection of guides; Click and drag to create a circle. Hit enter when it's the size you want. Go to Windows's Dockable Dialogues way. With an open set of Dockable Dialogs- Paths tools, click on the Transform Choice button. This converts the circle into a path that the text will follow, but first click on button to select (circle) in the Paths toolkit. This button will make the chosen path aka circle visible. Click on the Select menu and then don't. Create text by selecting a text tool, click on the canvas area and enter the text. Change the font and size to whatever you want by clicking on it three times or using Ctrl-A. Next on the right, click the text layer and select the zgt; along the way. This adds text to the circle layer or the first layer layer Choice. Choose a move tool and turn off the text layer. Click on the background layer, then click to create a new layer. Tap normally and make the new layer active by clicking on it. Click back to dock the dialogue of the Toolbox's way. Now turn off the path visibility (a layer showing curved text). Then select the Circle layer and click on the foreground color to select the color of the text you want to have. I'm exhausted to the green and click okay. Go to edit the qgt; fill in with the color of the foreground. Finish by clicking Select No. Now turn off the visibility of the circle. Go to Paths Dialog and press the left button (visibility) next to the choice showing the circle. Under the image of the guides, remove all guides to turn off the guides. From the top menu, drag the new horizontal guide. Go to the rotation tool. Click at the beginning of the text and drag to turn the text around the horizontal guide to where you want it to be. Click on the Rotation button. Click back on the Move tool than build a horizontal guide from the bottom edge of the text. Click on the rotation tool and rotate again until the text you stich as you wish. You can repeat this as many times as necessary to get the curved text wherever you want it. Note that the text is curved in a convex path. What if you need curved text in a concave way. The process is very similar. Using the above process, use steps 1 - 8. Now click on the Flip tool button and click into the vertical radiobox in the options tool. Make sure the layer with the circle is active by clicking on it. Go to Dockable Dialogue's layers. Click on the text layer, select the Text option along the paths. The new version of the text is shown and curved like a concave one. Now repeating the previous steps, you can create a new layer, fill the color and so on. Using steps 8 - 12 to create concave text. Watch the video. Here it is. Three very useful tools for creating curved or curved concave text in a few minutes. And if you decide you want to add cool special effects to your curved text, you can easily do so with Inkscape or GIMP. If you liked it, consider sharing it. Thank you.
